## Q1 Handling ArithmeticException

10 marks

Write a Java program to divide two integers entered by the user. If the denominator is zero, handle the exception using a try-catch block and display an appropriate error message.

## Your Code

```
1 public class Main {
2     public static void main(String[] args) {
3         int numerator = 10;
4         int denominator = 0;
5         try {
6             int result = numerator / denominator;
7             System.out.println("Result: " + result);
8         } catch (ArithmeticException e) {
9             System.out.println("Error: Cannot divide by zero.");
10        }
11    }
12 }
```

Run

Save

## Input

stdin input

## Output

Error: Cannot divide by zero.

## Q2 Handling ArrayIndexOutOfBoundsException

10 marks

Write a Java program to create an integer array of five elements. Ask the user to enter an index and display the corresponding element. If the index is outside the valid range, handle the exception and display an error message.

## Your Code

```
1 public class Main {
2     public static void main(String[] args) {
3         int[] numbers = {10, 20, 30, 40, 50};
4         int index = 7;
5         try {
6             System.out.println("Element at index " + index + " is: "
7             ) catch (ArrayIndexOutOfBoundsException e) {
8                 System.out.println("Error: Index " + index + " is out of
9             }
10        }
11    }
```

Run

Save

## Input

stdin input

## Output

Error: Index 7 is out of bounds for the array.

## Q3 Handling NumberFormatException

10 marks

Write a Java program to accept a number as a string and convert it into an integer using Integer.parseInt(). If the input is not a valid integer, handle the exception and display an appropriate message.

## Your Code

```
1 public class Main {
2     public static void main(String[] args) {
3         String str = "abc123";
4         try {
5             int num = Integer.parseInt(str);
6             System.out.println("Converted integer: " + num);
7         } catch (NumberFormatException e) {
8             System.out.println("Invalid input! Cannot convert to an integer.");
9         }
10    }
11 }
```

Run

Save

## Input

stdin input

## Output

Invalid input! Cannot convert to an integer.

Write a Java program that performs the following operations:

Accept two integers from the user.

Divide the first number by the second.

Store the result in an array.

Handle both ArithmeticException and ArrayIndexOutOfBoundsException using multiple catch blocks.

## Your Code

```
1 public class Main {  
2     public static void main(String[] args) {  
3         int num1 = 10;  
4         int num2 = 0;  
5         int[] result = new int[2];  
6         try {  
7             result[0] = num1 / num2;  
8             System.out.println("Result stored at index 0: " + result[0]);  
9             result[1] = num1 / 2;  
10            System.out.println("Result stored at index 1: " + result[1]);  
11        } catch (ArithmeticException e) {  
12            System.out.println("ArithmeticException caught: " + e.getMessage());  
13        } catch (ArrayIndexOutOfBoundsException e) {  
14            System.out.println("ArrayIndexOutOfBoundsException caught: " + e.getMessage());  
15        } finally {  
16            System.out.println("Execution completed.");  
17        }  
18    }  
19 }
```

Run

Save

## Input

stdin input

## Output

```
ArithmeticException caught: / by  
zero.  
Execution completed.
```
